

## Plastic perfection

Our gutters withstand sun, wind and rain for many years.

The production takes place in Germany on modern and energy-saving injection molding and extruder systems.

### PVC Gutter

The gutter is a component that collects the rainwater running off the roof surface and drains it off the roof via a downpipe to prevent waterlogging.

The individual gutters are connected by means of gutter connectors, the fastening with gutter supports/holders - also known as gutter irons. Channel end pieces ensure a professional finish.

Channel size: RG 100 (up to 60 m<sup>2</sup> roof area)
